

Concept Design Report · Option C

SYNTHETIC DEMO ? illustrative training case, not an authentic project record.

Synthetic status

SYNTHETIC DEMO ? illustrative training case, not an authentic project record. The report is fabricated to exercise PDF preview and content extraction. It is not an adopted urban design document.

Concept

Option C combines repair of viable high-rise structures with a new blue-green spine and active street edges. The proposal is intended to test a decision sequence, not to prescribe a final plan.

Key dimensions

The illustrative framework covers 28 hectares, retains three tower footprints, introduces a 1.2-kilometre connector, and tests approximately 180 new homes. A 480 cubic metre rainwater storage target is carried into the next design stage.

Trade-offs

Repair reduces embodied carbon and displacement but requires intrusive surveys. Edge infill improves address and tenure diversity but creates daylight, wind, servicing, and affordability constraints. Landscape storage improves resilience but requires maintenance and water-authority agreement.

Next gate

Before design development, confirm structural capacity, ground conditions, flood discharge, resident continuity, public-realm ownership, and the first delivery package. The decision log should record the evidence and the accountable decision-maker.
